2	How do you approach test automation strategy for a mature, complex application with a large existing codebase?	I prioritize a layered approach: UI for end-to-end validation, API for core logic, and unit tests for granular checks. I also focus on test data management, parallel execution, and integrating automation into CI/CD pipelines for early feedback.
3	Describe a time you had to influence a team or stakeholder to adopt a new testing practice or tool. What was your approach and the outcome?	I presented data on the benefits (e.g., reduced defect leakage, faster release cycles) and conducted a pilot with a small group to demonstrate its value. Building consensus through clear communication and addressing concerns was key to successful adoption.
4	When dealing with performance testing, what key metrics do you track, and how do you interpret them to identify bottlenecks?	I track response times, throughput, error rates, and resource utilization (CPU, memory, network). I analyze trends, spikes, and deviations from baseline to pinpoint specific areas of the system causing performance degradation.
5	Imagine a critical production issue arises. What's your immediate action plan and your role in its resolution?	My first step is to verify the issue and gather as much information as possible (logs, user reports, steps to reproduce). I then communicate the severity and impact to stakeholders, collaborate with development on root cause analysis, and work on a quick fix or workaround while advocating for a permanent solution.
6	How do you ensure testability is considered early in the development lifecycle, especially in an Agile environment?	I advocate for 'shift-left' testing by participating in requirement reviews and backlog grooming. I also encourage developers to write testable code and involve QA in design discussions to identify potential testing challenges upfront.
7	What's your experience with non-functional testing types beyond performance, such as security or usability, and how do you integrate them into a test strategy?	I have experience with security vulnerability scanning and basic penetration testing, as well as usability heuristics and user feedback analysis. I integrate these by working with specialized teams or by incorporating basic checks into our standard QA processes.
8	How do you manage and prioritize testing efforts when faced with tight deadlines and limited resources?	I focus on risk-based testing, prioritizing critical functionalities and high-impact areas. I also leverage existing automation, encourage exploratory testing for quicker feedback, and maintain open communication with the team about priorities and trade-offs.

9	Describe your approach to mentoring junior QA engineers. What are the most important skills you try to impart?	I focus on teaching critical thinking, problem-solving, and understanding the 'why' behind testing. I encourage them to ask questions, explore the system thoroughly, and develop strong communication skills. Practical guidance on test design and execution is also crucial.
